ABSTRACT OF THE DISCLOSURE

A content delivery service includes causing a set of page objects to be replicated across a wide area network of servers which may be managed by a domain other than an origin server domain. For a given page normally served from the origin server domain, causing the embedded objects of the page to be served from the domain instead of the origin server domain. Responsive to a request for the given page received at the origin server domain, the given page is served from the origin server domain; and at least one embedded object of the given page is served from a given server in the domain instead of from the origin server domain.
